TABLE OF CONTENTS

Introduction	1
I. Total Energy Consumption and Total Energy	
Expenditures	2
Total Energy Consumption	3
Total Energy Expenditures	9
II. Energy Consumption, Prices and Expenditures by	
Consuming Sector	14
Residential	15
Commercial	18
Industrial	21
Transportation	24
Electric Utility	27
III. Energy Resource Statistics	30
Natural Gas	31
Petroleum	39
Electricity	49
Coal	55
IV. Crude Oil, Natural Gas, Ethanol and Gasohol Statistics	61
Petroleum, Natural Gas and Gasohol Production	62
V. Electricity Generation Statistics	70
Electricity Generation	71
VI. Miscellaneous Statistics	87
VII. Appendices	107
A. Conversion Factors	108
B. Glossary	111

About Our Cover

The Energy Office logo, a detail of which appears on the front cover, is a mosaic by Hildreth M. Meiere, entitled "Genius of Creative Energy". The figure is a mythical symbol who controls the sun, moon, stars and four winds with his reins. The mosaic is found on the second floor of the Nebraska State Capitol building in Lincoln just inside the north doors.

This Statistical Handbook is published pursuant to Nebraska Revised Statutes, Sections 81-1607.
Copies are on file with the Clerk of the Legislature and Nebraska Library Commission.

TABLE OF FIGURES

Figure No.	Page No.
1. Consumption of Energy Resources by Type, Nebraska, 1960-1988	3
2. Consumption of Energy Resources by End-Use Sector, Nebraska, 1960-1988	4
3. Per Capita Energy Consumption, Nebraska and United States, 1960-1988	7
4. Energy Consumption Per Constant Dollar of Gross State Product, Nebraska and Energy Consumption Per Constant Dollar of Gross National Product, United States, 1960-1988	8
5. Total Energy Expenditures for Nuclear, Coal, Natural Gas and Petroleum, Nebraska, 1970-1988	9
6. Total Energy Expenditures and Electricity Expenditures, Nebraska, 1970-1988	9
7. Energy Expenditures by End-Use Sector, Nebraska, 1970-1988	10
8. Per Capita Energy Expenditures, Nebraska and United States, 1970-1988	12
9. Energy Expenditures per Dollar of Gross State Product, Nebraska and Gross National Product, United States, 1970-1988	13
10. Residential Sector Net Energy Consumption by Fuel Type, Nebraska, 1988	15
11. Residential Sector Total Energy Consumption by Fuel Type, Nebraska, 1988	15
12. Residential Sector Electricity and Coal Prices by Fuel Type, Nebraska, 1970-1988	16
13. Residential Sector Petroleum and Natural Gas Prices by Fuel Type, Nebraska, 1970-1988	16
14. Residential Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988	17
15. Commercial Sector Net Energy Consumption by Fuel Type, Nebraska, 1988	18
16. Commercial Sector Total Energy Consumption by Fuel Type, Nebraska, 1988	18
17. Commercial Sector Electricity and Coal Prices, Nebraska, 1970-1988	19
18. Commercial Sector Gasoline, Propane, Diesel Fuel, Other Petroleum and Natural Gas Prices, Nebraska, 1970-1988	19
19. Commercial Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988	20
20. Industrial Sector Total Energy Consumption by Fuel Type, Nebraska, 1988	21
21. Industrial Sector Net Energy Consumption by Fuel Type, Nebraska, 1988	21
22. Industrial Sector Electricity and Coal Prices, Nebraska, 1970-1988	22
23. Industrial Sector Gasoline, Propane, Other Petroleum, Diesel Fuel and Natural Gas Prices, Nebraska, 1970-1988	22

TABLE OF FIGURES (CONTINUED)

INTRODUCTION

Nebraska Energy Office Energy Statistics, 1960-1988 presents the most current information available about Nebraska's energy consumption and production. This publication is intended to provide energy planners, policy makers and consumers with a useful reference so that informed energy decisions can be made.

This report is divided into seven sections. The first presents an overview of energy use and trends in the state. The second section covers energy use and trends in the residential, commercial, industrial, transportation, and electric utility sectors. The third section provides specific information on consumption and trends for natural gas, petroleum, electricity, and coal. Section four contains production information for crude oil, natural gas and ethanol. Electricity generation and facilities are covered in section five. Section six contains miscellaneous energy information such as degree days, population, and motor vehicle data. Section seven contains conversion factors and a glossary of terms used in this publication.

This report was compiled and prepared by the Research Section of the Nebraska Energy Office. The statistical series presented represent those determined to be most useful. Every effort has been made to ensure accuracy.

Suggestions or comments regarding this publication are welcome.

I. TOTAL ENERGY CONSUMPTION AND TOTAL ENERGY EXPENDITURES

Tables

I-1	Consumption of Energy Resources by Type, Nebraska, 1960-1988	I-8	Total Energy Expenditures by Energy Type, Nebraska, 1970-1988
I-2	Consumption of Energy Resources by End-Use Sector, Nebraska, 1960-1988	I-9	Energy Expenditures by End-Use Sector, Nebraska, 1970-1988
I-3	Consumption of Energy by Fuel Type and Consuming Sector, Nebraska, 1986	I-10	Energy Expenditures by Fuel Type and Consuming Sector, Nebraska, 1986
I-4	Consumption of Energy by Fuel Type and Consuming Sector, Nebraska, 1987	I-11	Energy Expenditures by Fuel Type and Consuming Sector, Nebraska, 1987
I-5	Consumption of Energy by Fuel Type and Consuming Sector, Nebraska, 1988	I-12	Energy Expenditures by Fuel Type and Consuming Sector, Nebraska, 1988
I-6	Energy Consumption and Per Capita Energy Consumption, Nebraska and United States, 1960-1988	I-13	Total Energy Expenditures and Per Capita Expenditures, Nebraska and United States, 1970-1988
I-7	Energy Consumption and Energy Consumption per Constant Dollar of Gross State Product, Nebraska and Energy Consumption and Energy Consumption per Constant Dollar of Gross National Product, United States, 1960-1988	I-14	Total Energy Expenditures and Energy Expenditures per Dollar of Gross State Product, Nebraska, and per Dollar of Gross National Product, United States, 1970-1988

TOTAL ENERGY CONSUMPTION

There are two common ways to account for energy consumption: primary resource consumption and end-use energy consumption. End use refers to the energy content of electricity and other fuels at the point of use by consumers. Approximately 70% of the primary energy used to generate and distribute electricity is lost as waste heat. This loss is referred to as associated energy losses or electric system losses throughout this report. Unless otherwise noted, total energy consumption refers to total primary energy consumption adjusted for net interstate sales of electricity.

Total energy consumption in 1988 was 540.7 trillion Btus, just over a 7.5% increase from 1986. This compares with a peak consumption of 554.2 trillion Btus in 1977. Petroleum use increased 8.1% from 1987, natural gas use increased 12.5%, coal use increased 19.4%, nuclear power use decreased 20.8% and hydroelectric power decreased 13.6%. Overall, consumption of primary energy resources increased 5.8% in 1988 over 1987. Interstate sales of electricity decreased 19.9%.

Per capita energy consumption in Nebraska increased 7.0% in 1988 from 1987 to 315.5 million Btus. This compares to peak per capita consumption of 356.4 million Btus in 1976. Also, per capita consumption for Nebraska was nearly the same as the 315.4 trillion Btus per capita for the United States.

Sources: State Energy Data Report, Consumption Estimates, 1960-1987. Energy Information Administration, U.S. Department of Energy, Washington, D.C. April 1989. 1988 Preliminary Estimates. Nebraska Energy Office.

Notes: Primary energy consumption includes energy used in the generation of electricity whether that electricity is used in Nebraska or not. Net I/S (Interstate Sales) represents the difference between the energy in electricity sold (including associated losses) and the energy input at electric utilities in Nebraska. (Negative if exports, positive if imports.) From 1960-1964, a small amount of other energy was consumed.

Note: (1) Thousand Btu per 1982 dollar. 1982 dollars calculated using implicit GNP deflators.

TOTAL ENERGY EXPENDITURES

Expenditures on energy for 1988 were \$2,795.8 million, an increase of 6.3% from 1987, but 6.7% below the peak expenditures of \$2,996.2 million in 1985. Expenditures for petroleum products, natural gas, and coal were down dramatically from 1985 expenditures, primarily due to lower prices for these resources. Expenditures for electricity increased from 1987 to 1988 because of the increased use of electricity.

Per capita expenditures on energy in Nebraska increased to \$1,746.41 in 1988 from \$1,650.56 in 1987. Peak per capita expenditures were \$1,867.83 in 1985. In 1988, expenditures on energy represented 9.3 cents of each dollar of gross state product or the lowest level since 1973 when expenditures on energy represented 8.4 cents on each dollar of gross state product.

II. ENERGY CONSUMPTION, PRICES AND EXPENDITURES BY CONSUMING SECTOR

Overview

This section contains information on energy consumption, prices and expenditures for the residential, commercial, industrial, transportation and electric utility sectors.

For the residential, commercial and industrial sectors, a net total (less electrical system losses) is provided to indicate the energy actually consumed by these sectors. In addition, energy consumed in the generation, transmission and distribution of electricity is allocated to each sector based on the electricity consumed by the sector. Thus total consumption represents the energy consumed by the sector as well as that used to provide electricity to the sector.

Tables

II-1 Residential Sector Energy Consumption by Fuel Type, Nebraska, 1960-1988	II-8 Industrial Sector Energy Prices by Fuel Type, Nebraska, 1970-1988
II-2 Residential Sector Energy Prices by Fuel Type, Nebraska, 1970-1988	II-9 Industrial Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988
II-3 Residential Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988	II-10 Transportation Sector Energy Consumption by Fuel Type, Nebraska, 1960-1988
II-4 Commercial Sector Energy Consumption by Fuel Type, Nebraska, 1960-1988	II-11 Transportation Sector Energy Prices by Fuel Type, Nebraska, 1970-1988
II-5 Commercial Sector Energy Prices by Fuel Type, Nebraska, 1970-1988	II-12 Transportation Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988
II-6 Commercial Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988	II-13 Electric Utility Sector Energy Consumption by Fuel Type, Nebraska, 1960-1988
II-7 Industrial Sector Energy Consumption by Fuel Type, Nebraska, 1960-1988	II-14 Electric Utility Sector Energy Prices by Fuel Type, Nebraska, 1970-1988
	II-15 Electric Utility Sector Expenditures on Energy by Fuel Type, Nebraska, 1970-1988

RESIDENTIAL

The residential sector consists of private households.

Figure 10
Residential Sector Net Energy Consumption by Fuel Type, Nebraska, 1988
(Trillion Btu)

Energy is consumed primarily for space heating, water heating, air conditioning, refrigeration, cooking, clothes drying and lighting. Fuel used for motor vehicles by household members is included in the transportation sector.

Between 1987 and 1988, residential sector net energy use increased 9.6% to the highest level since 1985. Total energy attributed to the residential sector in 1988 increased 7.8% from 1987. Electricity use was up

Figure 11
Residential Sector Total Energy Consumption by Fuel Type, Nebraska, 1988
(Trillion Btu)

In 1988, residential sector expenditures on energy increased nearly 8.2% to \$648.2 million. This compares to peak expenditures of over \$687 million in 1983.

5.3% from 1987, natural gas use was up 12.3% from 1987, and petroleum use was up 9.3% from 1987.

In 1988, energy prices for the residential sector decreased from 1987 prices for coal, heating oil, propane and kerosene. Natural gas prices increased from 1987 levels and electricity prices remained nearly the same.

COMMERCIAL

level since 1984. Total energy attributed to the commercial sector in 1988 increased 6.8% from 1987. Electricity use was up 3.3% from 1987, natural gas use was up 15.4% from 1987, and petroleum use was down 23.1% from 1987.

Energy prices for the commercial sector in 1988 decreased from 1987 prices for coal and petroleum products. Natural gas and electricity prices increased over 1987 levels but remained below 1985 prices.

Commercial sector expenditures on energy increased 7.7% in 1988 to \$529.7 million. This exceeds the previous peak expenditures of \$516.7 million in 1985.

INDUSTRIAL

The industrial sector consists of manufacturing, construction, mining, agriculture and forestry organizations. Energy used by this sector to transport products to market or inputs to the organizations is included in the transportation sector.

Figure 20
Industrial Sector Total Energy Consumption by Fuel Type, Nebraska, 1987

(Trillion Btu)

used by this sector to transport products to market or inputs to the organizations is included in the transportation sector.

In 1988, industrial sector net energy use increased by 16.3% from 1987 to its highest level since 1980. Total energy attributed to the industrial sector in 1988 increased 13.2% from 1987. Electricity use was up 4.4% over 1986, natural gas use was up 37.7% over

1987, coal use eained the sameas in 1987, and petroleum use was up 11.3% from 1987.

Figure 21
Industrial Sector Net Energy Consumption by Fuel Type, Nebraska, 1987

(Trillion Btu)

In 1988, energy prices paid by the industrial sector decreased from 1987 prices for coal and petroleum products. Natural gas and electricity prices increased over 1987 prices.

Industrial sector expenditures on energy increased 6.8% in 1988 to \$527.8 million. This compares with peak expenditures of \$620.5 million in 1985.

TRANSPORTATION

The transportation sector consists of private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads, aircraft, ships, barges and natural gas pipelines. Natural gas use reflects the fuel needed to move natural gas through a pipeline to end users in the residential, commercial, industrial and electric utility sectors.

Transportation energy use in 1988 increased 7.9% from 1987 with large part of the increase reflected in diesel fuel consumption.

Prices of all petroleum products used in the transportation sector decreased from 1987 to 1988.

Figure 25
Transportation Sector Energy Consumption by Fuel Type, Nebraska, 1988
(Trillion Btu)

Transportation sector expenditures on energy increased 4.3% in 1988 to \$1,090.1 million. This compares with peak expenditures of \$1,334.3 million in 1981.

ELECTRIC UTILITY

The electric utility sector consists of generation facilities which generate electricity primarily for use by the public. Energy is used for the generation, distribution and transmission of electric power.

From 1987, energy use in the electric utility sector increased 0.7% to an all time high in 1988. This increase was due to a 20.4% increase in generation by coal and a 17.3% increase in generation by [etroleum and natural gas. Offsetting most of these increases were a 20.8% decrease in generation by nuclear power and a 13.6% decrease in generation by hydro-electric power.

Coal prices paid by the electric utility sector in 1988 decreased from 1987 prices. Petroleum and natural gas prices increased and the cost of nuclear fuel remained about the same.

Figure 29
Electric Utility Sector Energy Consumption by Fuel Type, Nebraska, 1988
 (Trillion Btu)

Electric utility expenditures on energy decreased 1.7% in 1988 to \$166.6 million. This compares with peak expenditures of \$191.7 million in 1984.

NATURAL GAS

Natural gas use in Nebraska for 1988 was 123 billion cubic feet, an increase of 13.9% from 1987. This is the second consecutive increase in natural gas use after a general decline in natural gas use in Nebraska since annual consumption peaked at 230 billion cubic feet in 1973.

Natural gas prices for 1988 increased in all sectors from 1987. The residential price increased 2.3%, the commercial price increased 1.0%, the industrial price increased 2.2% and the electric utility price increased 2.8%. This reverses a downward trend in natural gas prices in Nebraska since 1984.

Expenditures on natural gas in Nebraska increased from \$383.4 million in 1987 to \$440.9 million in 1988. The increase in expenditures resulted both from the higher prices and higher level of consumption. Expenditures on natural gas peaked at \$567.2 million in 1984.

Average consumption by a residential customer in 1988 increased 11.3% to 108 thousand cubic feet. Similarly, the average residential natural gas bill in 1988 increased 13.4%

from 1987 to \$481. The average residential natural gas bill peaked at \$622 in 1984.

Note: mcf = thousand cubic feet.

PETROLEUM

Petroleum use in Nebraska for 1988 was 41,363 thousand barrels, an increase of 7.9% from 1987. This is the first major change in petroleum use in Nebraska since 1982 and 1983. Petroleum use peaked at 46,218 thousand barrels in 1978 before falling sharply between 1979 and 1981 due to the rapid increase in prices. Use increased in 1982 and 1983 and 1987 and 1988 as prices decreased.

Petroleum prices in Nebraska decreased by 3.0% in 1988 from 1987 prices. Prices in 1988 were about the same as 1986 prices which were the lowest since 1979. For example, the

average gasoline price for 1988 was 92 cents per gallon compared with 91 cents in 1986, \$1.42 in 1981, and 93 cents in 1979.

Expenditures on petroleum increased to \$1,420.5 million in 1988, a 4.6% increase over 1987 expenditures. This compares with peak expenditures for petroleum of \$1,690.6 million in 1981.

Gasohol use in Nebraska of 258,161 thousand gallons in 1988 was a 6.7% increase over 1987 and 6.4% more than the previous record total of 242,606 thousand gallons used in 1985.

Note: For purposes of the Nebraska motor vehicle fuels tax, gasohol is defined as gasoline containing a minimum of 10% agricultural ethyl alcohol which is at least 99% pure. Gasohol available for sale is calculated as gasohol imported into Nebraska plus gasohol blended in Nebraska less gasohol exported to other states or sold to federal agencies.

ELECTRICITY

Electricity use in Nebraska increased to 17,498 million kilowatt-hours in 1988, a 4.3% increase over 1987 and a new all-time record. Electricity use was up in all sectors over 1987, including a 5.3% increase in the residential sector, a 3.4% increase in the commercial sector and a 4.2% increase in the industrial sector.

Prices for electricity remained constant in the residential sector and increased slightly in the commercial and industrial sectors in 1988, reflecting the lower cost of fuels used in the generation of electricity. Expenditures for electricity increased to \$933.1 million in 1988, 5.4% more than the \$885.7 million spent on electricity in 1987.

Average monthly residential electric bills in Nebraska continued to be among the lowest in the United States. For an average use of 500 kilowatt-hours, the average monthly bill in Nebraska was \$32.08, ranking 9th lowest nationally. For an average use of 750 kilowatt-hours, the average monthly bill was \$43.15, ranking 7th lowest nationally. The national average

monthly bill for 500 kilowatt-hours was \$41.21 and for 750 kilowatt-hours was \$57.39.

Source: *Typical Electric Bills*. Energy Information Administration, U.S. Department of Energy. Washington, D.C. Annual.

Notes: Rank of 1 indicates state with lowest average monthly bill. kWh = kilowatthour. 250 kWh and 500 kWh consumption levels typically include lighting, appliances, refrigeration and cooking. 750 kWh and 1000 kWh consumption levels typically include lighting, appliances, refrigeration, cooking and water heating. 2500 kWh consumption level typically includes lighting, appliances, refrigeration, cooking, water heating and space heating. The 2,500 kWh consumption level was not recorded for 1979 and prior years.

* The weighted average state residential bill for each energy consumption level is calculated as follows:

$$\frac{\sum_{\text{All communities in State}} B_c \times P_c}{\sum_{\text{All communities in State}} P_c}$$

where:

- c denotes a community or part of a community of 2,500 or more residents
- B denotes the average residential bill for a utility serving a community
- P denotes the population of community c.

Sources: *Annual Report*, Lincoln Electric System. Lincoln, Nebraska. *Annual Report*, Nebraska Public Power District. Columbus, Nebraska. *Annual Report*, Omaha Public Power District. Omaha, Nebraska. *Annual Report*.

Notes: Lincoln Electric System data for 1970-1977 are based on a fiscal year, other data is on a calendar year basis. Sales by the Lincoln Electric System, Nebraska Public Power District and Omaha Public Power District residential customers were 54% of total residential consumption in Nebraska in 1988.

Coal use in Nebraska for 1988 was 8,057 thousand short tons, a 19.5% increase over 1987 and a new record total. Coal use for electricity generation accounted for 96.1% of the coal used in Nebraska in 1988.

Coal prices for 1988 decreased 11.6% to the electric utility sector. Coal prices have shown a general decline since peaking in the late 1970s.

Expenditures on coal in Nebraska increased to \$120.6 million in 1988, a 5.7% increase from 1987 expenditures. This

compares to peak expenditures on coal of \$164.0 million in 1984.

Coal shipped into Nebraska was primarily low sulfur coal from Wyoming. In 1988, 96.6% of the coal used in Nebraska came from Wyoming. Also, 97.8% of the coal shipped to generating plants of 50-megawatt capacity or larger contained less than 0.5% sulfur. Nationally, only 25.17% of the coal shipped to generating plants of 50-megawatt capacity or larger contained less than 0.5% sulfur.

PETROLEUM, NATURAL GAS AND GASOHOL PRODUCTION

Petroleum production in Nebraska for 1988 was 5,978,429 barrels, a decrease of 1.8% from 1987 production of 6,090,931 barrels. This represents the lowest production level in Nebraska since 5,862,277 barrels were produced in 1978. There were 81 drilling permits issued in 1988 for exploratory wells, a decrease of 34% from the 123 permits in 1987. Similarly, the 67 permits issued for development wells in 1988 was a 27% decrease from the 92 issued in 1987. Petroleum production in 1988 from Nebraska represented 15.8% of the petroleum consumed in the state, though it should be noted that petroleum produced in Nebraska is first exported from the state for refining.

Natural gas production in Nebraska for 1988 was 910,468 thousand cubic feet, a decrease of 27.8% from 1987 production

of 1,260,540 thousand cubic feet. Production in 1988 was the lowest reported in Nebraska since production was first reported in 1950. Natural gas production in 1988 from Nebraska represented only 0.8% of the natural gas consumed in Nebraska during 1988.

Ethanol production in Nebraska in 1988 was approximately 11.1 million gallons, or about the same as the previous five years. Gasohol blended in Nebraska was 241 million gallons, an increase of 6.1% over the previous high of 227 million gallons set in 1987. (Note: Gasohol is a blend of 10% ethanol and 90% gasoline.) Ethanol produced in Nebraska was approximately 46% of the total used in blending gasohol in Nebraska in 1988.

Source: Basic Petroleum Data Book, Petroleum Industry Statistics. American Petroleum Institute. Washington, D.C. September 1988. U.S. Crude Oil, Natural Gas and Natural Gas Liquids Reserves. 1988 Annual Report. Energy Information Administration, United States Department of Energy. Washington, D.C. October, 1989.

Note: *Nebraska specific proven natural gas reserves have not been identified separately since 1976. Beginning in 1977, Nebraska reserves have been included with a group of states, including Arizona, Illinois, Indiana, Iowa, Maryland, Minnesota, Missouri, Oregon, South Dakota, Tennessee, Virginia and Washington. Individual Nebraska reserves are presented for 1960-1976 and the total for the miscellaneous states for 1977-1986.

Source: Computer printout based on Nebraska Department of Revenue Form 81. Nebraska Department of Revenue, Lincoln, Nebraska. Monthly.

Notes: Blended is the amount of gasohol blended in Nebraska. Imported is the amount of gasohol imported into Nebraska. Exported is the amount of gasohol exported from Nebraska plus the amount sold to federal agencies. Total represents the amount of gasohol available for sale in Nebraska and is defined as: Blended and Imported minus Exported. * represents less than 500 gallons.

ELECTRICITY GENERATION

Generation of electricity in Nebraska reached a record high of 20,633 gigawatthours (million kilowatthours) in 1988. This was 0.7% above the previous record of 20,489 gigawatthours set in 1987. Coal accounted for 59.2%, nuclear power 33.1%, hydro-electric power 6.5% and natural gas and petroleum 1.1% of the power generated. Nebraska remained a net exporter of electricity.

Generation by coal was a record 12,225 gigawatthours in 1988, an increase of 20.4% from 1987 and 14.1% above the previous record of 10,717 gigawatthours set in 1984. Generation by nuclear power decreased by 20.5% in 1988 to 6,828 gigawatthours from 1987. This decrease was due to the increase in scheduled downtime for maintenance and refueling in 1988 over 1987. Generation from hydro-electric power decreased 13.8% in 1988 to 1,351 gigawatthours. Generation from natural gas and petroleum increased 20.0% and 51.0% respectively in 1988 from 1987.

Nuclear power generation by Nebraska Public Power district's Cooper Station was 4,201 gigawatthours. Generation from Omaha Public Power District's Fort Calhoun Station was 2,627 gigawatthours. It should be noted that by contract 50% of the production of Cooper Station belongs to the Iowa Power and Light Company.

Purchases of electricity from the Western Area Power Administration represented approximately 12% of electricity used in Nebraska in 1988. This electricity was obtained by municipalities, state agencies and public utility districts in Nebraska at a cost of 0.97 cents per kilowatthour.

Definitions: Generator Nameplate = The full-load continuous rating of a generator, prime mover or other electrical equipment under specified conditions as designated by the manufacturer.
Capability = The maximum load that a generating unit, generating station or other electrical apparatus can carry under specified conditions for a given period of time without exceeding approved limits of temperature and stress.

Notes: *Unit Types: GT = Combustion (gas) Turbine
 HC = Hydraulic Turbine - Conventional
 IC = Internal Combustion (diesel)
 NB = Steam Turbine - Boiling Water Nuclear Reactor
 NP = Steam Turbine - Pressurized Water Nuclear Reactor
 ST = Steam Turbine - Boiler

*Energy Source: B = Bituminous Coal
 S = Subbituminous Coal
 N = Natural Gas
 U = Uranium
 P = Petroleum
 W = Water

A second energy source for a generating unit denotes alternate fuel capabilities.

Generator Nameplate = The full-load continuous rating of a generator, prime mover or other electrical equipment under specified conditions as designated by the manufacturer.

Capability = The maximum load that a generating unit, generating station or other electrical apparatus can carry under specified conditions for a given period of time without exceeding approved limits of temperature and stress.

Note: Nebraska customers of the Western Area Power Administration in 1988 included were 61 municipalities, 1 rural electric cooperative, 9 state agencies and 3 public utility districts.

VI. MISCELLANEOUS STATISTICS

Overview

This section includes other data such as heating and cooling degree days, population, motor vehicle registrations, motor vehicle mileage and irrigation acreage which have an impact on the consumption of energy in Nebraska.

Sources: *Climatological Data, Nebraska*. National Oceanic and Administration. Asheville, N.C. Monthly. Cooling degree days for 1975-1979 calculated by the Nebraska Energy Office from reported temperatures in *Climatological Data, Nebraska* for Chadron, McCook, Holdrege, O'Neill and Pawnee City.

Notes and Sources for Tables VI-3-VI-14

Notes: When information for degree days was not reported, values for nearby stations were substituted. Months and stations affected follow:
 Chadron: Data missing for November, 1986 through October, 1987; July, 1988; and August 1988. Values for Hay Springs substituted.
 McCook: Data missing for November, 1978 through June, 1979. Values for Culbertson substituted.
 North Platte: Data missing for January, 1985. Values for North Platte Experiment Station substituted.
 Omaha: Data missing for October, 1979 and August, 1987. Values for North Omaha substituted.
 Pawnee City: Data missing for December, 1979; October, 1980; April, 1982; April, 1983; March 1988; and September 1988. Values for Falls City substituted.

VII. APPENDIX A. CONVERSION FACTORS

Tables

A-1	Units of Measure	A-4	Conversion Factors for Natural Gas and Coal Consumed in Nebraska, 1960-1988
A-2	Approximate Heat Content of Petroleum Products		
A-3	Approximate Heat Rates for Electricity, 1960-1988		

Table A-1
Units of Measure

Coal		
1 metric ton	contains	1,000 kilograms or 2,204.62 pounds
1 long ton	contains	2,240 pounds
1 short ton	contains	2,000 pounds
Crude Oil		
1 barrel	contains	42 gallons

Source: *State Energy Data Report, Consumption Estimates 1960-1987*. U.S. Department of Energy, Energy Information Administration. Washington, D.C. April 1989.

Table A-2
Approximate Heat Content of Petroleum Products

Product	Million Btu per barrel	Btu per gallon
Asphalt	6.636	158,000
Aviation Gasoline	5.048	120,190
Crude Oil	5.800	138,095
Distillate Fuel Oil	5.825	138,690
Jet Fuel, Kerosene type	5.670	135,000
Kerosene	5.670	135,000
Lubricants	6.065	144,405
Motor Gasoline	5.253	125,071
Propane	3.836	91,333
Residual Fuel Oil	6.287	149,690
Road Oil	6.636	158,000

1971	3,412	10,478	-
1972	3,412	10,379	-
1973	3,412	10,389	10,903
1974	3,412	10,442	11,161
1975	3,412	10,406	11,013
1976	3,412	10,373	11,047
1977	3,412	10,435	10,769
1978	3,412	10,361	10,941
1979	3,412	10,353	10,879
1980	3,412	10,388	10,908
1981	3,412	10,453	11,030
1982	3,412	10,454	11,073
1983	3,412	10,520	10,905
1984	3,412	10,323	10,843
1985	3,412	10,339	10,813
1986	3,412	10,261	10,799
1987	3,412	10,318	10,865
1988	3,412	10,318	10,865

Source: *State Energy Data Report, Consumption Estimates 1960-1987*. U.S. Department of Energy, Energy Information Administration. Washington, D.C. April 1989.

*Notes: The heat content of a kilowatthour of electricity for consumption is 3,412 Btu regardless of the generation process. The heat content for a fossil fuel steam-electric power plant is assumed to be the average at all such U.S. power plants. This factor is also applied to convert hydroelectricity for distribution.

Table A-4
Conversion Factors for Natural Gas and Coal Consumed in Nebraska, 1960-1988

	Natural Gas (Btu/cubic foot)		Coal (Thousand Btu/short ton)		
	Utility	Non-Utility	Residential/ Commercial	Industrial	Electric Utility
1960	1,035	1,035	20,913	21,975	24,782
1961	1,035	1,035	20,896	21,943	24,796
1962	1,035	1,035	20,890	21,933	24,552
1963	991	991	20,872	21,903	24,316

VII. APPENDIX B. GLOSSARY

Asphalt: A dark-brown-to-black cement-like material containing bitumens as the predominant constituents, obtained by petroleum processing.

Aviation Gasoline: All special grades of gasoline for use in aviation reciprocating engines.

Barrel: A volumetric unit of measure for crude oil and petroleum products equivalent to 42 U.S. gallons.

British Thermal Unit (Btu): A standard unit for measuring the amount of energy required to raise the temperature of one pound of water 1 degree.

Fahrenheit: An average Btu content of fuel is a heat value per unit quantity of fuel as determined from tests of fuel samples.

City Gate Price: Price of natural gas at the point it is transferred from a pipeline to a local distribution company.

Coal: A black or brownish-black solid combustible substance formed by the partial decomposition of vegetable matter without access to air.

Commercial Sector: Nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, laundries and other service enterprises; health, social and educational institutions; and federal, state and local governments. Street lights, pumps, bridges and public services are also included.

Crude Oil: A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities.

Degree Days, Cooling: The number of degrees that the daily average temperature is above 65 degrees Fahrenheit. The daily average temperature is the average of the maximum and minimum temperatures for a 24-hour period.

Degree Days, Heating: The number of degrees that the daily average temperature is below 65 degrees Fahrenheit. The daily average temperature is the average of the maximum and minimum temperatures for a 24-hour period.

Degree Days, Normal: Simple arithmetic averages of monthly or annual degree days over a long period of time (usually the 30-year period, 1951-1980).

Degree Days, Population Weighted: Heating or cooling degree days weighted by the population of the area in which the degree days are recorded. To compute state population weighted degree days, each state is divided into from one to nine climatically homogeneous divisions which are assigned weights based on the ratio of the population of the division to the total population of the state.

Development Well: A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

Diesel Fuel: See Distillate Fuel.

Distillate Fuel: Light fuel oils distilled during the refining

process and used primarily for space heating, on- and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery) and electric power generation. Diesel fuel oils are used in compression-ignition engines.

Electrical System Energy Losses: The amount of energy lost during generation, transmission, and distribution of electricity, including plant use and unaccounted for electrical energy.

Electric Utility Sector: Privately and publicly owned establishments for the generation, transmission, distribution or sale of electric energy, primarily for use by the public.

End Use Energy: A measure of the energy content of fuels at the point where they are consumed. End use energy does not include energy lost in the generation and transmission of electricity.

Exploratory Well: A well drilled to find and produce oil or gas in an unproved area; to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir; or to extend the limit of a known oil or gas reservoir.

F.O.B.(free on board): The price actually charged at the point of loading.

Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol but sometimes methanol) in which 10 percent or more of the product is alcohol.

Gasoline: A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that have been blended to form a fuel suitable for use in spark-ignition engines. Includes finished leaded motor gasoline (premium and regular), finished unleaded motor gasoline (premium and regular), motor gasoline blending components and gasohol.

Heating Oil: A distillate fuel oil for use in atomizing-type burners for domestic heating or for moderate capacity commercial and industrial burner units.

Hydroelectric Power (Hydro): Electricity generated by an electric power plant whose turbines are driven by falling water.

Industrial Sector: Sector including manufacturing, construction, mining, agriculture, fishing and forestry establishments.

Jet Fuel: Includes both Naptha-type and kerosene-type jet fuel. Although most jet fuel is used in aircraft, some is used for other purposes, such as fuel for turbines to produce electricity.

Kerosene: A petroleum middle distillate, having burning properties suitable for use as an illuminant when burned in wick lamps. Kerosene is primarily used in space heaters, cooking stoves and water heaters.

Kilowatt: One thousand watts (see Watt).

Kilowatthour: One thousand wathours (see Watthour).

Lubricants: Substances used to reduce friction between bearing surfaces. Petroleum lubricants may be produced from either distillates or residuals.

Megawatt: One million watts, or one thousand kilowatts (see Watt).

Middle Distillates: A general classification of fuels that includes heating oil, diesel fuel and kerosene.

Natural Gas: A mixture of hydrocarbons and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in natural underground reservoirs.

Net Interstate Sales of Electricity: The difference between the amount of electricity sales and electricity losses (due to generation and transmission) within Nebraska and the total amount of energy used in generating electricity within the state.

Nuclear Power: Electricity generated by an electric power plant whose turbines are driven by steam produced in a reactor by heat from the fissioning of nuclear fuel.

Petroleum: A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oils, petroleum products, natural gas plant liquids and nonhydrocarbon compounds blended into finished petroleum products.

Primary Energy: A measure of the energy content of energy resources consumed including the energy lost in the generation and transmission of electricity.

Primary energy resources include: petroleum products, natural gas, coal, hydro-electric power and nuclear power.

Propane: A normally gaseous hydrocarbon extracted from natural gas or refinery gas streams. Propane is used primarily for residential and commercial heating and cooling and also as a fuel for transportation. Also included for purposes of this report are other liquified petroleum gases such as ethane, butane, etc. Industrial uses of propane include use as a petrochemical feedstock.

Proved Reserves: The estimated quantities of crude oil or natural gas which geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Residential Sector: Sector consisting of private households which consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking and clothes drying.

Residual Fuel: The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations. Residual fuel is used for commercial and industrial heating and electricity generation.

Road Oil: Any heavy petroleum oil, including residual asphaltic oil used as a dust palliative and surface treatment on roads and highways.

Special Fuels: Fuel which is delivered into a fuel supply tank of a motor vehicle or into special fuel storage facilities designed or equipped to fuel motor vehicles. Special fuels include, but are not limited to, diesel and liquid petroleum gases. Gasoline is not a special fuel.

Stripper Well: Wells which produce less than ten barrels of crude oil per day.

Transportation Sector: Sector including private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroad and railways (including streetcars), aircraft, ships, barges and natural gas pipelines.

Watt: The electrical unit of power. The rate of energy transfer equivalent to one ampere flowing under a pressure of one volt at unity power factor.

Watt-hour (Wh): An electrical energy unit of measure equal to one watt of power supplied to or taken from, an electric circuit steadily for one hour.

Wellhead Price: The price at which all domestic crude oil and natural gas is first purchased at the point of production.
